The target is not “final-years”. It is the final-year in placement season whose resume has no AI project.

WHO EXACTLY

- **2027 batch, B.E. or B.Tech,** in 7th-semester placement season right now.
- **Tier-2 and tier-3 colleges, every branch.** ECE, EEE, Mech and Civil students feel furthest from AI and are the least served.
- **Reached where they already are:** the class and batch WhatsApp groups of 25 to 30 campuses.
- **Not chasing:** juniors (no urgency yet) and already-placed toppers (no need).

I am in this segment. Final-year, Medical Electronics, Ramaiah Institute of Technology, graduating 2027. This is my own batch.

WHY THEY WOULD CARE

“Every JD says AI. My resume doesn’t.”

They need proof, not another course.

“Tell me about a project you built.”

They need something they can demo in an interview.

“Major-project review is coming and we have no idea.”

They need a starting point this month.

“No time, no money, and I’m not from CS.”

It has to be free, 60 minutes, zero prerequisites.

SO THE PROMISE IS

Build the AI project your resume is missing. In 60 minutes.

An outcome with a clock on it, not a syllabus.

WHAT MAKES THEM REGISTER, AND WHAT I BUILT FOR IT

A specific outcome	They build and deploy an AI Resume Analyzer and leave with a live link for the resume.
A classmate, not a brand	Campus Captains post in their own class groups.
20 seconds, no login	Three fields. College is prefilled from the link.
Friends are going	Live count, “invited by”, and a squad unlock.
A real deadline	Registration closes Sunday 6 PM.

WHAT WOULD STOP THEM, AND MY ANSWER

“I’m not from CS.”	“No coding background needed” sits in the first two lines of every message.
“Another webinar to watch.”	You build it yourself. The takeaway is a link, not notes.
“I’ll forget by Sunday.”	Calendar add on the pass, a WhatsApp group, three reminders.

Assumptions. Cold start: I have the brand name, ₹2,000 and 7 days, and no NxtWave lists, handles or paid team (if those exist, they are upside). · The workshop is Day 7, Sunday 7 PM. · Only 2027-batch registrations count toward 500, so the tracker filters by graduation year. · The 60-minute build is an AI Resume Analyzer, to be confirmed with the content team.

One loop, three channels: classmates seed it, squads multiply it, clubs are the buffer.

1 · SEED
24 Campus Captains post in class and batch WhatsApp groups. 8 clubs and placement cells mail their lists.

→

2 · CONVERT
One page, three fields, 20 seconds. The headline is A/B tested on Day 2.

→

3 · MULTIPLY
Every registrant gets a squad code: 3 teammates join, all four unlock the Final-Year Project Idea Pack.

→

4 · MEASURE
Every link has an owner. Each night the tracker says what is short and what to do about it.

CHANNEL, IN PRIORITY ORDER	WHAT I DO	WHY IT SHOULD WORK	OF 592 PLANNED
1. Class and batch WhatsApp groups via Campus Captains · the base	Recruit 30 captains in 36 hours: my own network, DMs to club leads and class reps, then captains refer captains. Each gets a tracked link and ready-to-paste posts for the week: class group, batch group, then reposts with the live count.	A classmate’s message in a 65-person class group gets read; an ad does not. The ask is small and timely: free, 60 minutes, in placement season.	**346** direct · 58.4%
2. Squad referral on WhatsApp 1:1 and project groups · the multiplier	The success screen hands every registrant a code, a pre-written WhatsApp message and a progress bar. Unlocks at 3, 5 and 10. Student and college leaderboards.	Final-year projects already run in teams of 3 or 4, so “bring your squad” maps to a group that exists. The rewards are digital and useful this semester, so they cost ₹0.	**190** referred · 32.1% · K 0.35
3. Clubs and placement cells email and community broadcast · the buffer	8 partners (coding clubs, IEEE and CSI chapters, placement cells), each with a tracked link and a ready-to-send mail.	One send reaches a whole batch. Intent is lower and juniors are on the list, so it is the buffer, not the base.	**56** direct · 9.5%

WHAT I AM NOT DOING, AND WHY

- **Paid ads.** Even at ₹20 a lead, ₹2,000 buys 100 registrations.
- **Influencers and creators.** No relevant creator at this budget, and lead times longer than the week.
- **Posters and on-ground.** Cannot cover 25 campuses in 7 days, and nothing is attributable.
- **Cold email or SMS to scraped lists.** Low trust, consent risk, and it costs the brand.

₹2,000: DISTRIBUTION IS FREE, SO THE MONEY BUYS RECOGNITION

₹1,000
Campus Captain prizes
top 3: ₹500, ₹300, ₹200

₹500
Top 5 student squads
₹100 each

₹500
Reserve, released only on Day 4 data

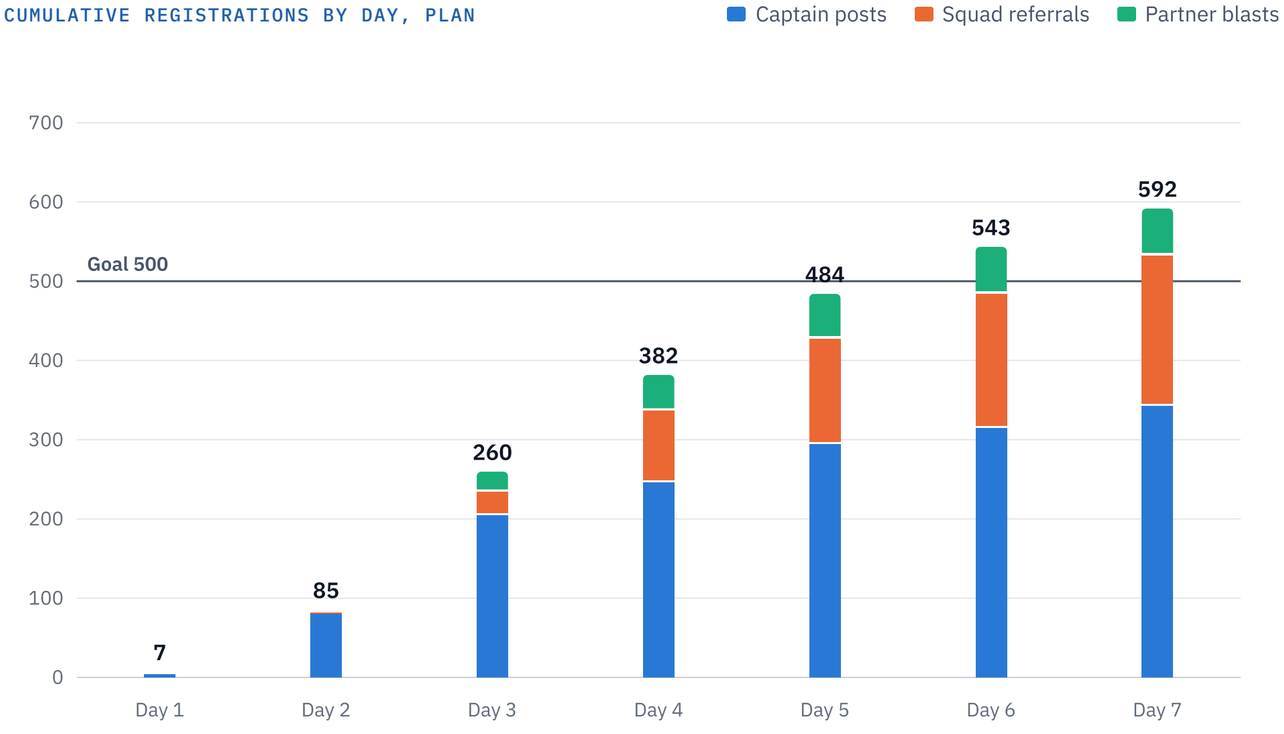

₹4.00
per registration at 500
(₹3.38 at plan)

How 500 comes in: 24 active captains bring about 21 registrations each. Partner blasts are the buffer.

THE WHOLE PLAN ON ONE LINE

24	×	**300**	×	**12%**	×	**40%**	=	**346**	+	**56**	+	**190**	=	**592**
active captains of 30 recruited		final-years reached each class ~65 · batch ~190 · other ~55		open the link across the week's posts		register three-field form		direct from captain posts		from 8 partner blasts 250 reached × 8% × 35%		through squad referrals K 0.35, landing a day later		plan total 18% above the goal

CUMULATIVE REGISTRATIONS BY DAY, PLAN

Crosses 500 on Day 6. Referrals land a day after the registration that caused them; anything after Day 7 is not counted.

PER ACTIVE CAPTAIN

21 registrations: 14 direct and 7 through their squads. I recruit 30 and plan on 24 posting; 20 are enough to clear 500.

IF I AM WRONG ABOUT EVERY RATE AT ONCE

CLICK, REGISTRATION AND K	TOTAL	CAPTAINS NEEDED FOR 500
all 20% worse	**347**	37
as planned	**592**	20
all 20% better	**936**	11

WHAT THE MODEL TELLS ME TO DO

- **Rates multiply.** A 20% miss on each is a 41% miss on the total, so I watch each rate every night, never just the total.
- **Captain count is the one input I can change inside a day.** Every checkpoint decision is "how many more captains do I switch on?"
- **These are assumptions until Day 2.** The tracker replaces each with a measured rate and re-forecasts the week.

Seven days: launch Tuesday 7 PM, read three tests by Thursday, and decide on data at the Day 4 checkpoint.

DAY 1 · MON

Build and recruit

Recruit 30 captains. Soft launch in my own class and batch groups to break the funnel before anyone else sees it.

Plan **7**

DAY 2 · TUE

Wave 1, 7 PM

Captains post in class groups. Hook A/B split by captain. First real read on clicks and registrations.

Plan **85**

DAY 3 · WED

Read, ship, widen

Test 1 read at noon; winner shipped. Batch groups at 1 PM. Partner mails start.

Plan **260**

DAY 4 · THU

Checkpoint

Hostel and project groups. Tests 2 and 3 read. The ₹500 reserve is released to whatever is short.

Plan **382**

DAY 5 · FRI

Wave 2, 7 PM

Repost with the live count and the college leaderboard as social proof.

Plan **484**

DAY 6 · SAT

Squad deadline

“One more to unlock” to everyone at 2 of 3. Captains’ final push.

Plan **543**

DAY 7 · SUN

Close and show up

Last call 10 AM. Registration closes 6 PM. Reminders at T-24h, T-1h, T-10min. Workshop 7 PM.

Plan **592**

TEST 1 · HOOK

Moves the registration rate

Hypothesis. In placement season an outcome promise (“Build the AI project your resume is missing”) converts more visits than a learning promise (“Learn to build with AI”).

Test. Split captains 50/50 on Day 2. Same form; only the first line of the post and the headline change.

Metric. Visit → registration rate.

Decision. Day 3 noon. Ship the winner if it leads at 95% confidence.

TEST 2 · REFERRAL FRAMING

Moves K, the referral rate

Hypothesis. “Bring your project squad, all four unlock” gets more shares than “Invite 3 friends”, because final-year teams already exist.

Test. Randomise the success-screen framing per registrant, Days 2 to 4.

Metric. Share rate, with K (referred registrations per registrant) as the check.

Decision. Day 4, 6 PM. The winner goes to every registrant.

TEST 3 · SENDER

Decides where Days 5 to 7 go

Hypothesis. A classmate’s post brings at least 1.5× the final-year registrations of an official club or placement-cell blast.

Test. Run both on separate tracked links, Days 2 to 4.

Metric. Final-year registrations per 100 final-years reached.

Decision. Day 4 checkpoint. The ₹500 reserve and my hours follow the winner.

DECISION RULES, SET BEFORE LAUNCH

Fewer than 20 captains posting	**Supply.** Captain-get-captain; the reserve becomes a bounty.
Clicks per post under 80% of plan	**Message.** Winning hook, one personal line, pin the post.
Registration rate under 32%	**Page.** Winning headline; test the form on a low-end Android.
K under 0.25	**Loop.** Squad framing for all; nudge everyone at 2 of 3.

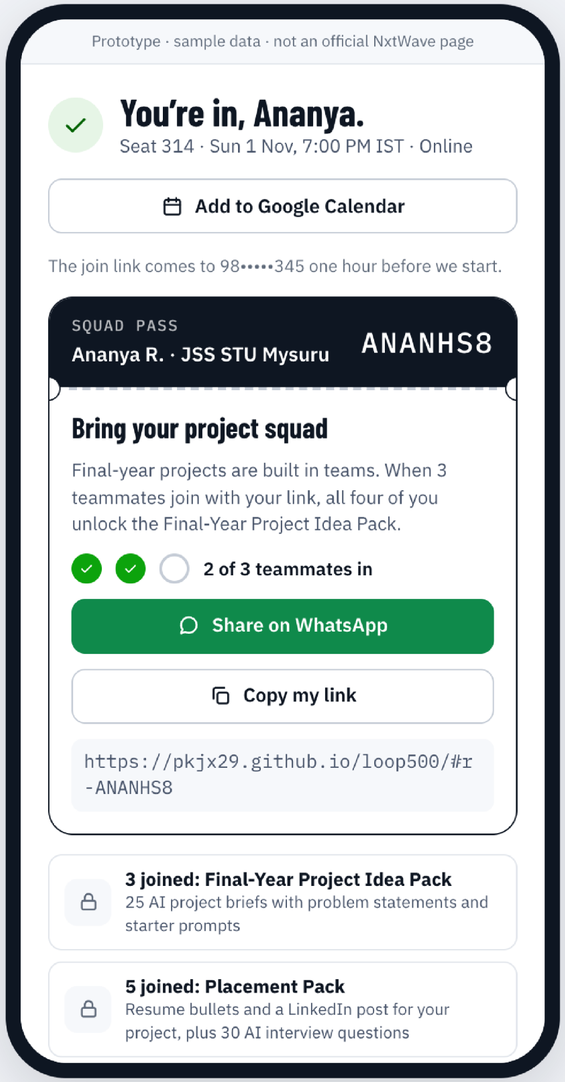

WHAT I TRACK

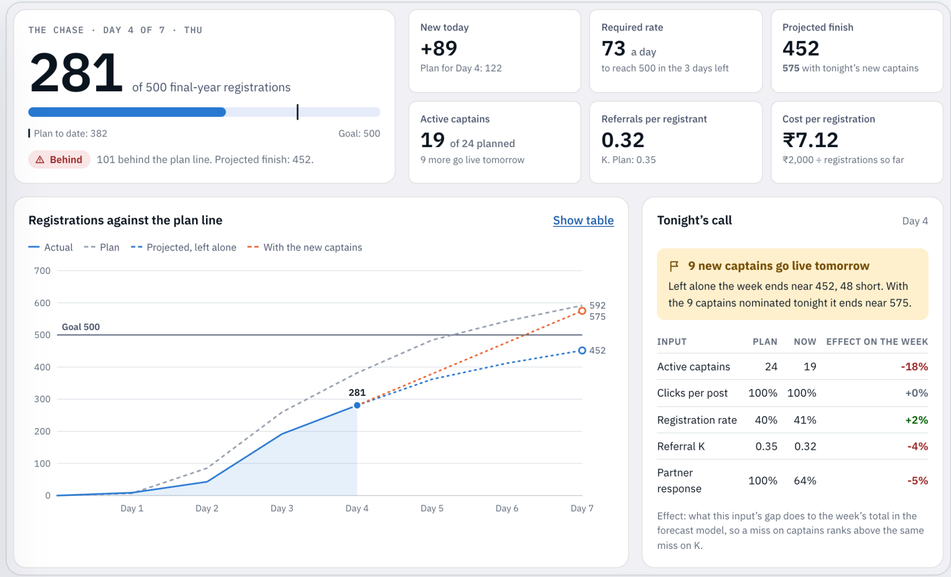

North star: final-year (2027) registrations. **Inputs:** active captains, clicks per post, registration rate, K. **Guardrails:** one WhatsApp number per seat, never more than one post a day in a group. **Next:** show-up rate.

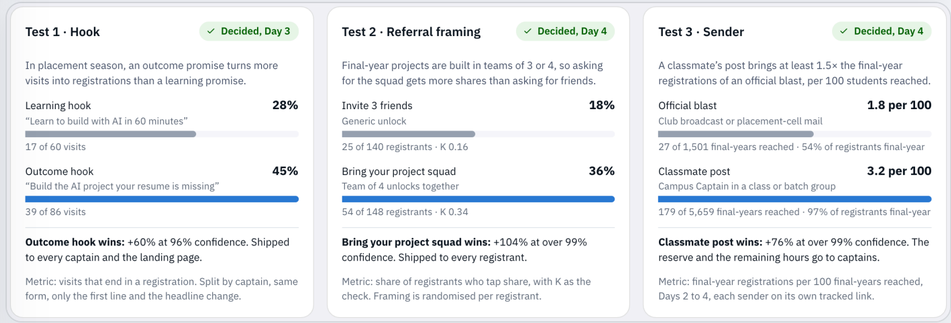

Assumed week: Mon 26 Oct to Sun 1 Nov 2026, after Dasara (20 Oct) and before Diwali travel (8 Nov).

Priyanshu Kumar Jha · final-year B.E., Ramaiah Institute of Technology, Bengaluru

What I built: Loop500, the referral engine and tracker that runs this plan.

Student flow. Three fields, college prefilled from the link, a squad pass with a ready WhatsApp invite.

Mission control. Plan against actual, the funnel, three A/B tests with significance, one action a night.

Attribution. Every link has an owner, so every registration is credited to a captain, club or student.

Forecast. The model on slide 3 with sliders, re-run on the rates the tracker has measured.

LIVE · SCAN TO OPEN IT AS A STUDENT WOULD

pkjx29.github.io/loop500

Checked with 10 unit tests on the model and 79 browser checks on the flow. The sample data is a simulated week; your own registrations are counted on top.

THE REPLAY INSIDE IT

Day 4: **281** against a plan of 382. The tracker reads it as a supply problem (19 of 24 captains posting, rates at plan) and projects **452**. Adding 9 captains ends the week at **578**. Switch that decision off and it ends at **454**.

HOW I THOUGHT

First idea → final. A landing page with a share button and a ten-channel plan became one loop, one input I control (active captains) and a tool that tells me what to do each night.

What AI suggested that I rejected. A WhatsApp Business API bot: about ₹1,500 in template fees for three nudges to 592 people. A forecast with K at 0.63: cut to 0.35 with ±20% cases. Paid ads and a long channel list: see slide 2.

With 24 more hours. Put both hooks in front of ten final-years from my own batch, move storage to a shared backend so codes work across devices, and wire the reminders in n8n.
